Germany is the home country of good beers. There are many different kinds of beer on the market, like plane ale, brown ale, wheat beer and others. For all these different kinds of beers there are standard norms to analyze ingredients and to check the quality parameters. These standard norms are defined by MEBAK (central-European brewery technological analysis commission) and EBC (European Brewery Convention).

The SPECORD® PLUS family of Analytik Jena offers diverse options to perform brewery analysis conforming to these norms.

The WinASPECT® PLUS software contains pre-programmed methods for this specific requirements. In this way the measuring procedure as well as result calculation can be performed easily and comfortably.
The WinASPECT® PLUS software module brewery analysis offers several parameters for the quality control of beer conforming MEBAK and EBC. The following photometric parameters can be tested all together or individually.

**Photometric methods for beer analysis:**
- Free amino nitrogen (FAN)
- Color (EBC-Method)
- Total polyphenole
- Anthocyanogene
- Bitter substances
- Alpha acid
- Vicinale Diketone
- Iodine
- Sulfite
- Ethanol
- Absorbance integral
